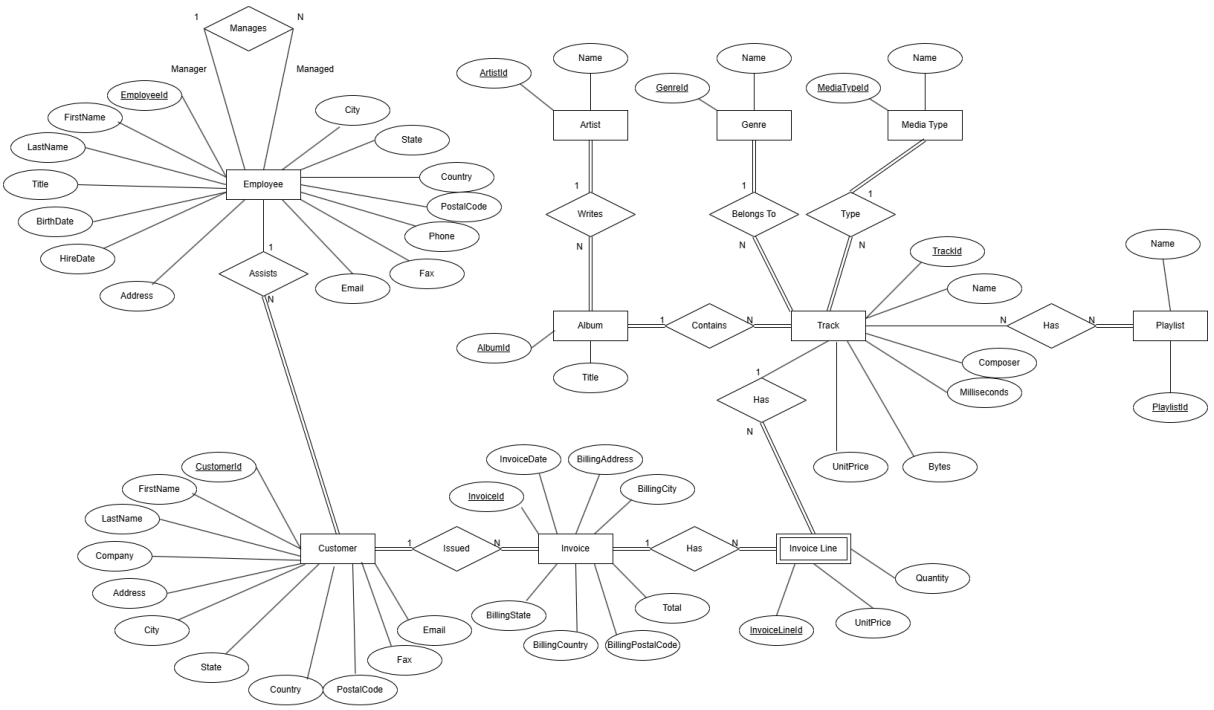
3)



3.2)

Invoice table:

Primary Key (InvoiceId) INT
Foreign Key (CustomerId) INT

DATA:

InvoiceDate DATETIME
BillingAddress VARCHAR
BillingCity VARCHAR
BillingState VARCHAR
BillingCountry VARCHAR
BillingPostalCode VARCHAR

Total DECIMAL

The keys are INTs as they are an efficient way to store a key.

InvoiceDate is a DATETIME to accurately store the date and time that an invoice is issued.

The billing information is stored as a VARCHAR so the information can be stored accurately and accommodate longer or shorter names

Total is a DECIMAL with 2 decimal places to represent money.

Every Invoice has one Customer to which it is issued to, and has multiple Invoice Lines depicting what tracks were sold.

However, one Customer can have multiple Invoices and each Invoice Line belongs to only one Invoice.
